

Jordan R. Kelly

TECHNICAL LEAD · FULL STACK, SYSTEMS AND ARCHITECTURE

Central Pennsylvania | github.com/Jordunkelly | contact via GitHub

PROFILE

Principal level full stack engineer with eleven years of professional experience. Technical lead for three production applications and two developers on a mission critical U.S. Navy program. Sole technical authority over the flagship platform, owning architecture, data model, front end, test strategy, and the CI/CD release pipeline. Turns incomplete requirements into working systems, and gets pulled into unfamiliar systems across the portfolio to unblock delivery. Most recent release cycle: 71,000 lines across four months, one production defect at release, resolved in minutes.

Equally fluent in modern React and TypeScript, independently building a commercial desktop application from concept through v1.0.0: architecture, security model, test coverage, CI/CD distribution, and go to market preparation as a solo engineer. Proven record of delivering stable, high performance systems under strict compliance, uptime, and stakeholder pressure inside DoD environments.

TECHNICAL SKILLS

Languages · Java, JavaScript, TypeScript, Oracle PL/SQL, SQL, T-SQL, Python, PHP, Perl, HTML5, CSS

Platforms and cloud · Linux, Unix, Windows, Windows Server, Oracle Database 12c through 23c, Oracle APEX, AWS GovCloud

Front end · React, Next.js 15, Bootstrap 5, Tailwind CSS, jQuery, AJAX, DataTables, Highcharts, Vite

Backend and data · Node.js, PL/SQL packages, materialized views, indexing strategy, query optimization, REST API design, JSON data contracts, Prisma, SQLite, MySQL

Testing · Vitest, Playwright, unit testing, end to end and behavioral testing, test automation, regression testing

DevOps · Agile, Scrum, CI/CD pipelines, Azure DevOps (Boards, Repos, Pipelines), Git, GitHub, release engineering, automated build and release, code signing

AI and agentic engineering · Agentic coding workflows (Claude Code, Antigravity), versioned agent rules and skills, MCP integration, parallel agent worktrees with collision interlocks, static analysis guard tests and automated verification gates, structured JSON contracts, Claude / OpenAI / Grok / Gemini APIs

EXPERIENCE

Full Stack Developer / Team Lead

2020 to present

DoD contractor, U.S. Navy program

- Technical lead for three production applications inside a large multi-application portfolio. Lead two developers, and routinely get pulled into systems outside the owned portfolio to unblock delivery.
- Rebuilt a program that had failed twice: architected and delivered the flagship platform's first stable release as sole engineer, with no design team, no dedicated QA, and no product owner. Owned front end through CI/CD.
- Formally commended in writing by the government mission partner for technical execution, user centric design, and stakeholder communication.
- Built API integrations with DoD systems of record, working directly with the owning agency teams to move supply chain data in and out.
- Rebuilt the data layer on optimized PL/SQL packages, a clean indexing strategy, and a JSON contract decoupling UI from schema. Eliminated systemic N+1 patterns via pre-aggregating CTEs and materialized views. Cut 60 to 90 second page loads to under a second (~800ms).
- Unblocked a production launch stalled by withheld source data, reconstructing a fragmented requirements picture across multiple government organizations that had no shared source of truth.
- Own the CI/CD release pipeline end to end, from build through production promotion. Supported the program's AWS GovCloud migration on the application side, validating application behavior in the new environment and working with a system administrator to troubleshoot access and authentication issues.
- Pioneered Java integration into a stack that had no Java path, delivering the team's first automated PDF read/write pipeline with Apache PDFBox. Now the standard approach across the team's applications.
- Delivered modern single page application UX inside a legacy server rendered stack, working within imposed platform limits: ES5 only on locked down browsers, self hosted libraries, no CDN, no CSS variables.
- Designed the platform's role based access control model (RBAC): hierarchical group scoping with per group data isolation, so each group sees only its own work. Built a configuration driven form and workflow engine that lets customers change business logic without a code deployment.
- Built a custom release pipeline with rollback safety for a deployment model with no native guarantee of restoration: an object level diff with change reporting, plus full backup snapshots of the blob object tables before promotion.
- Built and maintain the reporting and analytics layer that measures performance against the targets in a signed multi year interagency contract, surfacing weighted throughput metrics for program review. Engineered on materialized views for performance at scale.
- Develop to DoD secure coding standards and STIG guidance, delivering into a system governed by RMF and ATO processes owned on the government side.

Front End Web Development Instructor

2018 to 2021

- Led applied curriculum in HTML5, CSS, and JavaScript through project based instruction, mentoring students through hands on build work.

Application Developer

2016 to 2020

- Introduced Git based version control and built internal PHP, MySQL, and jQuery frameworks supporting dynamic organization wide application builds.

Programmer Analyst

Healthcare sector

- Built and maintained Java and Perl applications supporting hospital operations on a custom stack hosted across Linux servers, working daily in a Unix and Linux environment.

Technical Specialist · Owner, independent consultancy

- Public safety web application development. Full stack development and IT consulting for small business clients.

INDEPENDENT PROJECTS

Hoard v1.0.0 · commercial personal finance desktop application (shipping)

Electron · Next.js 15 · TypeScript · React · Tailwind · Prisma · SQLite · Vitest · Playwright

Sole engineer and product owner, from initial architecture through release readiness. Scoped the product, designed the security model, built the UI/UX, wrote the test suite, and assembled the distribution pipeline without a team, design resource, or external funding. Reads transaction alerts a bank already emails you and turns them into live cash flow forecasting, automatic bill detection, and spending analytics, without requiring bank credentials or a Plaid token.

No server, no telemetry, no account. That one rule decided the storage layer, the auth model, the update channel, and the licensing. There is nothing to breach because there is nothing out there. Mailbox credentials are sealed against the OS keychain, so a copied database file is useless on anybody else's machine.

Full build and distribution pipeline: one click installer, code signing, dependency provisioning, and schema migration on install.

Agentic Software Development

Claude Code · Antigravity · Agent rules and skills · MCP · Parallel worktrees · Verification gates

Build and ship commercial software through agentic toolkits, using per task model selection, plan driven execution, parallel agent worktrees for concurrent workstreams, and versioned agent rules and skills maintained as first class artifacts.

Built automated verification harnesses that block release on any failed content, structural, or regression check. Prompt chaining, structured JSON output contracts, and agent driven workflows applied to release engineering, data migrations, and automated test generation.

EDUCATION

A.S. Web Development, supplemented by eleven years of professional software engineering experience.
